

Magnesium Hydroxide Addition

Magnesium Hydroxide (Mg(OH)) is being added at the Wyoming Street Pump station during the summer months. However, the addition is needed year round and we are currently waiting for bids for a building to house the bulk Mg(OH) storage tank we have. Due to freezing weather it is necessary to enclose the tank in a building with a small heater and the chemical pumps inside.

It is planned to have the building in place prior to this winter.
