

The 14" Flushing Hydrant project consists of tapping the main feed line from the Harding Street elevated tank. The tap and flushing hydrant will be placed at the low point on Walnut Street near the cemetery. This hydrant will allow the 14" line to be flushed to help improve water quality.

This is just one step in the process of improving the water quality across the entire system.

As we stated at our first meeting we will be getting to the root cause of the problems, taking accountability and improving our system. However, each step in the process takes time so please be patient we are moving forward.
